

Vertically opposite angles

- 1 The diagram shows four angles formed by two straight lines.

- a) Measure the sizes of the angles.

$$a = 130^\circ \quad b = 50^\circ \quad c = 130^\circ \quad d = 50^\circ$$

- b) What is the total of angles a and b ?

$$180^\circ$$

Explain why.

Adjacent angles on a straight line sum to 180°

Do any other pairs of angles have this same total?

- c) Angles a and c are vertically opposite angles.

What do you notice about the sizes of angles a and c ?

They are equal.

- d) Angles b and d are also vertically opposite angles.

What do you notice about the sizes of angles b and d ?

They are equal.

- e) Complete the sentence.

Vertically opposite angles are equal.

- 2 Tick the pairs of angles that are vertically opposite.

Compare answers with a partner.

- 3 Work out the sizes of the unknown angles.

Give reasons for your answers.

- a)

$$y = 29^\circ \text{ because vertically opposite angles are equal.}$$

- b)

$$z = 132^\circ \text{ because vertically opposite angles are equal.}$$

- 4 Annie is working out the size of angle f .

Do you agree with Annie? No

Explain your answer.

The diagram doesn't show two straight lines crossing so the angles are not vertically opposite.

- 5 Work out the unknown angles.

Talk about your reasons with a partner.

- 6 Angle b is three times the size of angle a .

Work out the sizes of angles a and b .

$a = 20^\circ$ $b = 60^\circ$

- 7 Angle f is one quarter of the size of angle g .

Angle f is 28° .

Are angles x and y vertically opposite? No

Explain your answer.

$28 \times 4 = 112$ so $g = 112^\circ$
 $112 + 28 = 140$

$139 \neq 140$ therefore the diagram does not show vertically opposite angles.
